1. Introduction

This appendix provides a step by step process to determining the appropriate road and street design standards and requirements for utility provision in new roads and streets, and for new development including Material Change of Use and Reconfiguring a lot. The appendix provides the following separate processes to determining the applicable Road or Street Typology Cross Section.

1.1.1 - New or existing roads or streets identified in a Local Plan
1.1.2 - Existing roads or streets not identified in a Local Plan
1.1.3 - New roads or streets not identified in a Local Plan

A Road network plan may need be required to be prepared for new developments in order to determine the appropriate road and street functions and applicable cross sections. Refer to Figure 1. Further guidance on preparing a road network plan is contained in Planning Scheme Policy – Neighbourhood design, as part of preparing neighbourhood layouts.

Part 2 of the appendix provides the framework. Once the appropriate road cross section has been located, the appendix also provides the following additional standards and guidance material for the design and construction of new roads and streets in the region, as well as retrofitting or upgrading of existing streets and roads. Additional design criteria related to street design also located in this appendix includes Part 7 - Recommended Posted Speed Limits, Part 11 - Pedestrian Crossing Design and Locations, and Part 12 - Intersection Management.

5. Primary and Secondary Active Transport Route (additional criteria)
6. Transitions - for guidance on transitioning between road types and zones
7. Retrofitting Existing Streets - for guidance on fitting the applicable attributes into existing situations
8. Pavement Design and Construction
9. Street Lighting and Public Utilities - for guidance on the provision of street lighting, gas, electrical and telecommunications infrastructure
11. Intersection Management and Pedestrian Crossings - for the desired intersection control types, pedestrian-crossing types and maximum pedestrian-crossing spacing

Appendix A also includes the design and location standards for driveways and crossovers in Part 14 - Driveways, Vehicle and Pedestrian Crossovers, and servicing standards for all new development in Part 15 - Street Lighting and Public Utilities.

Reference is also made to Council’s standard drawings listed in the Appendix H of this policy for specific detailed design standards for each component of roads, streets and utilities. The diagrams provided in this appendix are for conceptual purposes only, to illustrate how the attributes fit into an integrated cross section. Reference is also made to Appendix D - Landscape Design and Street Trees with regards to planting requirements for street trees and general landscaping within the reserve and Appendix C – Stormwater Management for design requirements for stormwater infrastructure including WSUD components.

2. Road & Street Selection framework
New or existing roads or streets identified in a Local Plan

Has a Road or Street cross section been identified in the Local Plan?

Yes

Refer to applicable Cross Section in 4. Cross Section Attributes & 10. Street & Road Typology Cross Sections.

Design road or street in accordance with applicable Cross Section.

No

Refer to 3. Applicable Street and Road Typology Cross Sections. Use zone and road function to identify the applicable Cross Section.

Note: Additional criteria may apply if identified as an active transport route (see part 5)
1.1.1—Existing roads or streets not identified in a Local Plan

**Note:** Additional criteria may apply if identified as an active transport route (see part 5)
1.1.2 — New roads or streets not identified in a Local Plan

Is the road or street identified on a movement figure in the applicable zone code?

**YES**

Is the function of the road or street identified in a Road Network Plan?

**YES**

Refer to 3. Applicable Street and Road Typology Cross Section.

Use zone and road function to identify the applicable Cross Section.

Refer to applicable Cross Section in 4. Cross Section Attributes & 10. Street & Road Typology Cross Sections.

**NO**

Report a Road Network Plan to identify the functional road classification of the road/s or street/s.

Refer to 3. Applicable Street and Road Typology Cross Section.

Design road or street in accordance with applicable Cross Section.

Note: Additional criteria may apply if identified as an active transport route (see part 5)

Note: Refer to Planning Scheme Policy — Neighbourhood Design for guidance on road layouts and network design. Road Network Plan to indicate functional classification of road or street in accordance with 2. Functional Road and Street Classifications.
### 3. Functional Road and Street Classifications

<td></td>
<td></td>
</tr>
</tbody>
</table>
What is the Primary function of the road or street?

- Movement - to carry through traffic

Functions as a ROAD

- Regional cycle movements
- Line haul public transport
- Primary freight routes
- Provide through traffic intra-regional movements and longer distance travel to regional and destinations.
- Connections between destinations and arterial roads.
- Pedestrian movements and crossing
- Active transport facilities both on road and off road Regional, local cycle movement
- Accommodation of public transport

Does or will the road provide:

- Regional, local cycle movement
- Line haul public transport
- Primary freight routes
- Provide through traffic intra-regional movements and longer distance travel to regional and destinations.
- Connections between destinations and arterial roads.
- Pedestrian movements and crossing
- Active transport facilities both on road and off road Regional, local cycle movement
- Accommodation of public transport

Does the road provide:

- Regional cycle movements
- Line haul public transport
- Primary freight routes
- Provide through traffic intra-regional movements and longer distance travel to regional and destinations.
- Connections between destinations and arterial roads.
- Pedestrian movements and crossing
- Active transport facilities both on road and off road Regional, local cycle movement
- Accommodation of public transport

Does the arterial provide:

- Active transport physically separated from vehicles
- Regionally and nationally significant movements
- Connection to Highways and motorways
- Prioritize intra-regional movements
- Pedestrian movements

Functions as a STREET

- Access to individual properties and the local area
- Localized pedestrian movements
- Local cycle movements
- Direct property access

Does or will the street provide:

- Connections between destination, suburb, access streets to higher order roads.
- Connections between destination, suburb, access streets to higher order roads.
- Accommodation of public transport
- Prioritized Pedestrian movements and crossings.
- Dedicated cycle movement

Does the collector street provide:

- A major connections between 2 or more suburbs or between higher order roads
- Accommodation of public transport
- Prioritized pedestrian movements and crossings.
- Dedicated cycle movement

Does the collector street provide:

- A connection from a destination or access streets within a suburb to higher order streets or roads.
- Carry traffic having a trip and within the local area
- Prioritized pedestrian movements and crossings.
- Dedicated cycle movement

Does the access street provide:

- Access to individual properties and the local area
- Localized pedestrian movements
- Local cycle movements
- Direct property access

Functions as a HIGHWAY

- A connection from a destination or access streets within a suburb to higher order streets or roads.
- Carry traffic having a trip and within the local area
- Prioritized pedestrian movements and crossings.
- Dedicated cycle movement

Does the highway provide:

- A connection from a destination or access streets within a suburb to higher order streets or roads.
- Carry traffic having a trip and within the local area
- Prioritized pedestrian movements and crossings.
- Dedicated cycle movement

2. Cross Section Attributes

5. Street and Road Typology Conceptual Cross Sections & Attributes

1. Note: Parking on streets in the General Residential Zone is to be provided at the following rates:
   - Lots with frontages of 12.5m or less – 0.5 spaces per lot
   - Lots with frontages of greater than 12.5 metres – 1 space per lot

2. Note: Pathway width can be narrowed in short sections along a street/road corridor to cater for the retention of existing trees/vegetation, inclusion of bus stops, street furniture etc. Minimum of 1.5m width.

3. Note: If the development is proposing a new centre or industrial area outside of the existing centre or industry zone, the applicable road type for adjoining roads is taken to be if proposed in a centre or industry zone.

5.1 Access Residential

Indicative Road & Street Typology Cross Section

This typology is applicable to a road hierarchy of Access Street within the Suburban neighbourhood precinct only.

Carriageway: ✓
- Minimum width of 8 metres.
- Centre line, traffic lane or parking lane line-marking is not required. Carriageway is to allow for informal kerbside parallel parking to occur on both sides of the carriageway, whilst maintaining sufficient width to allow a refuse or emergency vehicle to pass unimpeded.

Pathway: ✓
- Minimum width 1.5 metres on one side of carriageway.

Cycle Lane: x
- Not required.

Street Trees: ✓
- Minimum of 1 tree per lot frontage.

Verge:
- 5.0 metres minimum width where containing a pathway;
- 3.5 metres where no pathway is provided.
- Where a verge contains a pathway, the front verge (between the edge of pathway and back of kerb) is to be a minimum of 2 metres wide, whilst the rear verge (between the edge of pathway and property boundary) is to be a minimum of 1.5 metre wide.

On Street Parking: ✓
- Minimum of 0.5 on street car parking spaces per lot frontage.
- Parking is to be provided informally within carriageway.

Direct Lot Vehicle Access: ✓
- Direct vehicle access is permitted.
- Lots with frontages of less than 10m that gain access directly from this road typology are to combine and share a single crossover in accordance with PSP - Neighbourhood Design.

Median: x
- Not required unless identified through detailed design for safety reasons.

Possible Bus Route: x
- Not required.
This typology is applicable to road hierarchies of Access Streets within the Next generation neighbourhood precinct and Local Collectors within the Suburban neighbourhood precinct.

**Carriageway:**
- Minimum width of 8 metres.
- Centre line, traffic lane or parking lane line-marking is not required. Carriageway is to allow for informal kerbside parallel parking to occur on both sides of the carriageway, whilst maintaining sufficient width to allow a refuse or emergency vehicle to pass unimpeded.

**Pathway:**
- Minimum width 2.0 metres on one side of carriageway.

**Cycle Lane:**
- Not required.

**Street Trees:**
- Minimum of 1 tree per lot frontage.

**Verge:**
- 5.0 metres minimum width where containing a pathway; or
- 4.0 metres where no pathway is provided.

Where a verge contains a pathway, the front verge (between the edge of pathway and back of kerb) is to be a minimum of 2 metres wide, whilst the rear verge (between the edge of pathway and property boundary) is to be a minimum of 1 metre wide.

**On Street Parking:**
- Minimum of 0.5 on street car parking spaces per lot frontage.
- Parking is to be provided informally within carriageway.

**Direct Lot Vehicle Access:**
- Direct vehicle access is permitted.

Lots with frontages of less than 10m that gain access directly from this road typology are to combine and share a single crossover in accordance with PSP - Neighbourhood Design.

**Median:**
- Not required unless identified through detailed design for safety reasons.

**Possible Bus Route:**
- Not
5.3 Contemporary Residential

Indicative Road & Street Typology Cross Section

This typology is applicable to road hierarchies of Local Collector Streets within the Next generation neighbourhood precinct and Local Collectors and Access Streets within the Urban neighbourhood precinct.

**Carriageway:**
- Minimum width of 3.3 metres per traffic lane.
- Centre line, traffic lane and parking bay line-marking is to be provided on this street type.
- Carriageway is to allow for kerbside parallel parking to occur on one or both sides of the carriageway, formalized by street tree build outs, whilst maintaining two clear through lanes.

**Pathway:**
- Minimum width 2 metres on both sides of carriageway.

**Cycle Lane:**
- Not required.

**Street Trees:**
- Minimum of 1 tree per lot frontage plus 1 tree in every build out.

**Verge:**
- 5.0 metres minimum width where containing a pathway; or
- 3.5 metres where no pathway is provided.
- Where a verge contains a pathway, the front verge (between the edge of pathway and back of kerb) is to be a minimum of 2 metres wide, whilst the rear verge (between the edge of pathway and property boundary) is to be a minimum of 1.5 metre wide.

**On Street Parking:**
- Minimum of 0.5 on street car parking spaces per lot frontage.
- Kerbside parallel parking bays are to be provided on at least one side of the carriageway, formalised by street tree build outs.

**Direct Lot Vehicle Access:**
- Direct vehicle access is permitted.
- Lots with frontages of less than 10m that gain access directly from this road typology are to combine and share a single crossover in accordance with Planning scheme policy on Neighbourhood design.

**Median:**
- Not required unless identified through detailed design for safety reasons.

**Possible Bus Route:**
This typology is applicable to Laneways in all precincts of the General Residential Zone as permitted by the Planning Scheme.

Carriageway: ✓
- Minimum width of 5 metres

Pathway: x
- Not required.

Cycle Lane: x
- Not required.

Street Trees: ✓
- Not required. Are permitted in verge dependent on appropriate size and species.

Verge: ✓
- 1.0 metre minimum width either side of carriageway.
  Verge width may be required to be widened to accommodate street lighting dependent on length of laneway and availability of space within mid lane pedestrian connections.

On Street Parking: x
- Parking is not to be accommodated on this street type.

Direct Lot Vehicle Access: ✓
- Direct vehicle access is permitted.
  Lots serviced by this street type must obtain vehicle access from it.

Median: x
- Not required

Possible Bus Route: x
- Not required.
This typology is applicable to District Collectors in all precincts of the General Residential Zone as permitted by the Planning Scheme.

**Carriageway:** ✓
- Minimum width of 3.3 metres per traffic lane.
- Centre line, traffic lane and parking bay line-marking is to be provided on this street type.
- Carriageway is to allow for kerbside parallel parking to occur on both sides of the carriageway, formalised by street tree build outs, whilst maintaining two clear through lanes and dedicated on road cycle lanes.

**Pathway:** ✓
- Minimum width 2.5 metres on both sides of carriageway.

**Cycle Lane:** ✓
- Minimum width of 2 metres per cycle lane on each side of the carriageway.

**Street Trees:** ✓
- Minimum of 1 tree per lot frontage or 25m of street length whichever is the greater.

**Verge:** ✓
- 5.5 metres minimum width including pathway.
- Where a verge contains a pathway, the front verge (between the edge of pathway and back of kerb) is to be a minimum of 2 metres wide, whilst the rear verge (between the edge of pathway and property boundary) is to be a minimum of 1.5 metre wide.

**On Street Parking:** ✓
- Minimum of 0.5 on street car parking spaces per lot frontage.
- Kerbside parallel parking bays are to be provided on both sides of the carriageway, formalised by street tree build outs.

**Direct Lot Vehicle Access:** ✗
- Direct vehicle access is generally not permitted. Council may consider alternative access arrangements on a detailed design basis.

**Median:** ✗
- Not required unless identified through detailed design for safety reasons.

**Possible Bus Route:** ✓
This typology is applicable to Arterial and Sub-arterial Roads in all Zones and precincts as permitted by the Planning Scheme.

**Carriageway:** ✓
- Minimum width of 3.5 metres per traffic lane.
Line-marking is to be provided on this street type. Carriageway is to allow a minimum of two clear through lanes as well as cycle lanes. Stated reserve width allows for additional traffic lanes in either direction depending on traffic analysis.

**Pathway:** ✓
- Minimum width 2.5 metres on both sides of carriageway.

**Cycle Lane:** ✓
- Minimum width of 2 metres per cycle lane on each side of the carriageway.

**Street Trees:** ✓
- Minimum of 1 tree per lot frontage or 25m of street length whichever is the greater.

**Verge:** ✓
- 5.5 metres minimum width including pathway.
Where a verge contains a pathway, the front verge (between the edge of pathway and back of kerb) is to be a minimum of 2 metres wide, whilst the rear verge (between the edge of pathway and property boundary) is to be a minimum of 1.5 metre wide.

**On Street Parking:** ×
- Parking is not to be accommodated on this street type.

**Direct Lot Vehicle Access:** ×
- Direct vehicle access is generally not permitted. Council may consider alternative access arrangements on a detailed design basis.

**Median:** ×
- Not required as a minimum, but is likely to be required as a result of detailed design at intersections and other conflict points i.e. pedestrian crossings.

**Possible Bus Route:** ✓
This typology is applicable to Local Collector Streets in the Industry zone as permitted by the Planning Scheme.

**Carriageway:**
- Minimum width of 3.5 metres per traffic lane.
Line-marking is to be provided on this street type. Carriageway is to allow a minimum of two clear through lanes as well as cycle lanes. Stated reserve width allows for additional traffic lanes in either direction depending on traffic analysis.

**Pathway:**
- Minimum width 2 metres on both sides of carriageway.

**Cycle Lane:**
- Minimum width of 2 metres per cycle lane on each side of the carriageway.

**Street Trees:**
- Minimum of 1 tree per lot frontage or 50m of street length whichever is the greater.

**Verge:**
- 5.5 metres minimum width including pathway on both sides of carriageway.
Where a verge contains a pathway, the front verge (between the edge of pathway and back of kerb) is to be a minimum of 2 metres wide, whilst the rear verge (between the edge of pathway and property boundary) is to be a minimum of 1.5 metre wide.

**On Street Parking & Build Outs:**
- 2.6 metres minimum width on both sides of carriageway.
Kerbside parallel parking lanes are to be provided on both sides of the carriageway, formalised by street tree build outs at a maximum spacing of 100m along the street length.

**Direct Lot Vehicle Access:**
- Direct vehicle access is permitted.

**Median:**
- Not required unless identified through detailed design for safety reasons.

**Possible Bus Route:**
-

</tbody>
</table>
This typology is applicable to Access Streets and Local Collectors in the Rural residential zone as permitted by the Planning Scheme.

**Carriageway:**
- Minimum width of 7 metres. Centre line, traffic lane or parking lane line-marking is not required. Carriageway is to allow for informal kerbside parallel parking to occur on both sides of the carriageway, whilst maintaining sufficient width to allow a refuse or emergency vehicle to pass unimpeded.

**Pathway:**
- The verge is to contain a minimum 2m clear pedestrian zone. Construction standards for pedestrian pathways if provided are located in Part 13 of this appendix.

**Cycle Lane:**
- Not required.

**Street Trees:**
- Minimum of 1 tree per lot.

**Verge:**
- 6 metres minimum width on both sides of carriageway. Where a verge contains a pathway, the front verge (between the edge of pathway and back of kerb) is to be a minimum of 2 metres wide.

**On Street Parking:**
- Parking is to be provided informally within carriageway.

**Direct Lot Vehicle Access:**
- Direct vehicle access is permitted.

**Median:**
- Not required unless identified through detailed design for safety reasons.

**Possible Bus Route:**
This typology is applicable to all Functional road hierarchy classifications in the Centre zone - Caboolture, Morayfield and Strathpine precincts where identified as a ‘Main Street’ by the Planning Scheme.

Carriageway: ✓
- Minimum width of 4.5 metres per traffic lane (where no cycle lane is provided)
- Centre line, traffic lane and parking bay line-marking is to be provided on this street type.
- Carriageway is to allow for kerbside parallel parking to occur on both sides of the carriageway, formalised by street tree build outs, whilst maintaining a minimum of two clear through lanes for shared vehicle and cycle movement, unless a dedicated cycle lanes can be provided.

Pathway: ✓
- Minimum width 6.5 metres on both sides of carriageway. Full constructed verge.

Cycle Lane: x
- Not required unless speed environment necessitates dedicated lanes.

Street Trees: ✓
- Minimum of 1 tree per 25m of street frontage.

Verge: ✓
- Minimum width 6.5 metres on both sides of carriageway

On Street Parking & Build Outs: ✓
- Kerbside parallel parking bays are to be provided on both sides of the carriageway, formalised by street tree build outs.

Direct Lot Vehicle Access: x
- Direct lot vehicle access to this road type is not to be provided to this road type.
- Consolidated access may be permitted dependent on detail design.

Median: x
- Not required unless identified through detailed design for safety reasons.

Possible Bus Route: ✓
This typology is applicable to all Functional road hierarchy classifications in the Centre zone - Caboolture, Morayfield and Strathpine precincts, and where identified as a ‘Main Street’ in the Centre zone - District centre precinct as permitted by the Planning Scheme.

**Carriageway:**
- Minimum width of 3.3 metres per traffic lane.
- Centre line, traffic lane and parking bay line-marking is to be provided on this street type.
- Carriageway is to allow for kerbside parallel parking to occur on both sides of the carriageway, formalized by street tree build outs, whilst maintaining two clear through lanes and dedicated on road cycle lanes.

**Pathway:**
- Minimum width 6 metres on both sides of carriageway.

**Cycle Lane:**
- Minimum width of 2 metres per cycle lane on each side of the carriageway.

**Street Trees:**
- Minimum of 1 tree per 25m of street frontage.

**Verge:**
- Minimum width 6 metres on both sides of carriageway.

**On Street Parking & Build Outs:**
- Kerbside parallel parking bays are to be provided on both sides of the carriageway, formalised by street tree build outs.

**Direct Lot Vehicle Access:**
- Direct lot vehicle access to this road type is not to be provided to this road type. Consolidated access may be permitted dependent on detailed design.

**Median:**
- Not required unless identified through detailed design for safety reasons.

**Possible Bus Route:**
### 5.12 Urban

#### Indicative Road & Street Typology Cross Section

This typology is applicable to all Functional road hierarchy classifications in the Centre Zone - District and Local Centre Precincts other than where on the fringe of a centre, identified as a laneway or a Main Street, and District Collectors and above in the Centre Zone - Strathpine, Morayfield, Caboolture or Redcliffe precincts other than where on the fringe of the centre or identified as a laneway, shared street or Main Street as permitted by the Planning Scheme.

This image shows the indicative road & street typology cross section with the following attributes:

- **Pathway:** Minimum width 5 metres on both sides of carriageway.
- **Cycle Lane:** Minimum width of 2 metres per cycle lane on each side of the carriageway.
- **Street Trees:** Minimum of 1 tree per 25m of streetfrontage.
- **Verge:** 5 metres minimum width on both sides of carriageway.
- **On Street Parking & Build Outs:** Kerbside parallel parking bays are to be provided on the Centre zone side of the carriageway, formalized by street tree build outs.
- **Direct Lot Vehicle Access:** Direct vehicle access is permitted.
- **Median:** Not required unless identified through detailed design for safety reasons.
- **Possible Bus Route:**
5.13 Urban Fringe

Typology Attributes

This typology is applicable to all Functional road hierarchy classifications adjoining the Centre zone (all precincts) on one side of the road reserve and General residential zone (all precincts) on the other side as permitted by the Planning Scheme.

Carriageway:
- Minimum width of 3.5 metres per traffic lane.
- Line-marking is to be provided on this street type. Carriageway is to allow a minimum of two clear through lanes as well as cycle lanes. Stated reserve width allows for additional traffic lanes in either direction depending on traffic analysis.

Pathway:
- Minimum width 5 metres on Centre zone side of carriageway.
- Minimum width 2 metres on other zone side of carriageway.

Cycle Lane:
- Minimum width of 2 metres per cycle lane on each side of the carriageway.

Street Trees:
- Minimum of 1 tree per lot frontage or 25m of street length whichever is the greater.

Verge:
- 5 metres minimum width on Centre zone side of carriageway.
- 5.5 metres minimum width including pathway on other zone side of carriageway.
- Where a verge contains a pathway, the front verge (between the edge of pathway and back of kerb) is to be a minimum of 2 metres wide, whilst the rear verge (between the edge of pathway and property boundary) is to be a minimum of 1.5 metre wide.

On Street Parking & Build Outs:
- Kerbside parallel parking bays are to be provided on the Centre zone side of the carriageway, formalised by street tree build outs.

Direct Lot Vehicle Access:
- Direct lot vehicle access to this road type may be permitted dependent on detail design.

Median:
- Not required unless identified through detailed design for safety reasons.

Possible Bus Route:
- Yes
### 5.14 Business Laneway

#### Indicative Road & Street Typology Cross Section

<table>
<thead>
<tr>
<th>Typology Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>This typology is applicable to Access Streets in the Centre zone where proposed to provide servicing, loading and rear parking access to development that otherwise fronts an alternative street type as permitted by the Planning Scheme.</strong></td>
</tr>
</tbody>
</table>

#### Carriageway:
- Minimum 7 metre carriageway.
- Centre line, traffic lane or parking lane line-marking is not required. Carriageway is to allow for informal kerbside short term loading and pickups to occur on both sides of the carriageway, whilst maintaining sufficient width to allow a refuse or emergency vehicle to pass unimpeded.

#### Pathway:
- Minimum width 2 metres on one side of carriageway.

#### Cycle Lane:
- Not required.

#### Street Trees:
- Not required.

#### Verge:
- Minimum width 2 metres on one side of carriageway where containing a pathway.

#### On Street Parking:
- Not required.

#### Direct Lot Vehicle Access:
- Direct vehicle access is permitted.

#### Median:
- Not required unless identified through detailed design for safety reasons.

#### Possible Bus Route:
- Not required.
5.15 Shared Business

This typology is applicable to Access Streets within the Centre zone (all precincts) where identified as a Shared Zone within the planning scheme or as part of a master-planned centre permitted by the Planning Scheme.

**Carriageway:**
- Minimum width of 10m constructed shared zone
  - Line-marking is not required to be provided on this street type, however stenciling or alternative surface treatments are to be used to delineate between shared zones and dedicated pathway areas.

**Pathway:**
- Minimum width 2.5 metres on both sides of carriageway.

**Cycle Lane:**
- Not required.

**Street Trees:**
- Minimum of 1 tree per 25m of street length.

**Verge:**
- Not required. Total of 15 constructed road reserve.

**On Street Parking:**
- On street parking is not to be provided on this street type.

**Direct Lot Vehicle Access:**
- Direct lot vehicle access to this road type is not to be provided to this road type.

**Median:**
- Not required unless identified through detailed design for safety reasons.

**Possible Bus Route:**
- Not required
This typology is an indicative representation of a standard road or street type which has been treated as a boulevard by the addition of a landscaped centre median. The cross section shown is that of an Arterial or Sub-arterial road typology which has a 6m centre median but remains as a single traffic lane in each direction.

Additional traffic lanes can also be added to District collector or higher order functional road classifications where traffic carrying capacity necessitates. The overall width of reserve required is to be widened by the additional widths of required lanes or median. All other attribute widths remain as per the standard road typology attributes.
5.17 Boulevard - Dual Carriageway

Indicative Road & Street Typology Cross Section

Typology Attributes

This typology is an indicative representation of a standard road or street type which has been treated as a boulevard by the addition of a landscaped centre median. The cross section shown is that of an Arterial or Sub-arterial road typology which has a 6m centre median and an additional traffic lane added.

Additional traffic lanes can also be added to District collector or higher road types where traffic carrying capacity necessitates. The overall width of reserve required is to be widened by the additional widths of required lanes or median. All other attribute widths remain as per the standard road typology attributes.
5.18 Caboolture West Main Street

Indicative Road & Street Typology Cross Section

<table>
<thead>
<tr>
<th>Typology Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>This typology is applicable where identified as a 'Main Street' by the Road Typologies Figure in Caboolture West Structure Plan Area 1.</td>
</tr>
</tbody>
</table>

**Carriageway:** ✓
- Minimum width of 3.3 metres per traffic lane
- Centre line, traffic lane and parking bay line-marking is to be provided on this street type.
- Carriageway is to allow for kerbside parallel parking to occur on both sides of the carriageway, formalized by street tree build outs, whilst maintaining a minimum of two clear through lanes for vehicle movement, and dedicated cycle lanes.

**Pathway:** ✓
- Minimum width 5 metres on centre sides of carriageway. Full constructed verge.
- Minimum width of 2 metres on other side of carriageway.

**Cycle Lane:** ✓
- Minimum width of 2 metres per cycle lane on each side of the carriageway.

**Street Trees:** ✔
- Minimum of 1 tree per 25m of street frontage.

**Verge:** ✓
- Minimum width 5 metres on centre side of carriageway.
- Minimum width 5.5 metres on other side of carriageway with the front verge (between the edge of pathway and back of kerb) being a minimum of 2 metres wide, and the rear verge (between the edge of pathway and property boundary) being a minimum of 1.5 metres wide.

**On Street Parking & Build Outs:** ✔
- Kerbside parallel parking bays at a minimum width of 2.4 metres are to be provided on both sides of the carriageway, formalised by street tree build outs.

**Direct Lot Vehicle Access:** ✗
- Direct lot vehicle access to this road type is not to be provided to this road type. Consolidated access may be permitted dependent on detailed design.

**Median:** ✗
- Not required unless identified through detailed design for safety reasons.

**Possible Bus Route:** ✔
5.19 Caboolture West Landscape Street

Indicative Road & Street Typology Cross Section

**Typology Attributes**

This typology is applicable where identified as a 'Landscape Street' by the Road Typologies Figure in Caboolture West Structure Plan Area 1.

**Carriageway:**
- Minimum width of 3.3 metres per traffic lane
- Centre line, traffic lane and parking bay line-marking is to be provided on this street type. Carriageway is to allow for kerbside parallel parking to occur on both sides of the carriageway, formalized by street tree build outs, whilst maintaining a minimum of two clear through lanes for vehicle movement, and dedicated cycle lanes.

**Pathway:**
- Minimum width 2 metres on eastern side of carriageway.
- Minimum width 3 metres on western side of carriageway.

**Cycle Lane:**
- Minimum width of 2 metres per cycle lane on each side of the carriageway.

**Street Trees:**
- Minimum of 1 tree per 25m of street frontage.

**Verge:**
- Minimum width 4.7 metres on eastern side of carriageway (with street frontage (between the edge of pathway and back of kerb) being a minimum of 1.8 metres wide, and the rear verge (between the edge of pathway and property boundary) being a minimum of 0.9 metres wide.
- Minimum width 8.5 metres on western side of carriageway.

**On Street Parking & Build Outs:**
- Kerbside parallel parking bays at a minimum width of 2.4 metres are to be provided on both sides of the carriageway, formalised by street tree build outs.

**Direct Lot Vehicle Access:**
- Direct vehicle access is permitted.

**Median:**
- Not required unless identified through detailed design for safety reasons.

**Possible Bus Route:**
- Yes
6. Typology Attributes Detail Criteria

6.1 Carriageway
   i. Carriageways in a Laneway are to allow for sufficient maneuvering of vehicles to access garages on one or both sides of the carriageway. Where a laneway is to provide for refuse collection it is also to ensure adequate turning movements are provided for the appropriate refuse vehicle type as specified in Planning Scheme Policy - Waste Management.

6.2 Pathway Width
   i. Pathway width may be narrowed to a width of not less than 1.5 metres for short distances to cater for the retention of existing trees or significant vegetation, accommodation of bus stops or street furniture, or due to significant topographical conflicts or safety concerns.
   ii. Roads with a Functional road hierarchy classification of Arterial, Sub-arterial or District Collector are to be designed to accommodate active transport movement both on and off-road. The minimum width of an off-road shared path is 2.5m.

6.3 Cycle Lane
   i. Street or road typologies that do not show on-road cycle lanes may still be required to provide them if the street is located on a Primary active transport route as identified on Overlay map - Active transport routes.
   ii. Where a street or road typology requires on-road cycle lanes, the specified width of cycle lanes as indicated combined with the specified width of on-street parking bays provides for the required cycle lane width within the speed environment and a 0.4 m safety clearance to ensure cyclists are clear of any potential conflict due to car door openings. Any reduction in cycle lane width or adjacent parking pay widths must consider adequate buffering to ensure vehicle doors to not cause conflict with cyclists travelling within the cycle lane. Refer to Standard Drawings in Appendix H for further details related to on-road cycle facilities.

6.4 Street Tree
   i. Street trees located in the front verge are to be planted from 45 litre pot sizes and provided with a minimum of 1.2 metres of clear verge width within the front verge. Trees planted in build outs are to be planted from 100 litre pot sizes. Where sufficient clear space to locate a tree in front of a particular lot cannot be provided, the required tree is to be planted elsewhere within the same street. Street trees are to be planted a maximum of 25 metres apart in General Residential and Centre zones and 50 metres in the Industry zone. Refer to Standard Drawings in Appendix H for further details on street tree plantings.

6.5 On-Street Parking & Build Outs
   i. Where a street typology requires build outs to formalise on-street parking bays, the build outs are to be provided at the same width as the parking bay, and at a maximum spacing of 50 metres along the street length unless otherwise specified.
   ii. Where formalized parking bays/lanes and build outs are required on both sides of a carriageway, the overall width of the reserve is to be widened by the required width of the parking bay unless otherwise agreed to by Council.
   iii. Parking spaces generated by lots accessed via a laneway are to be accommodated on the alternate street frontage of the lot and not within the laneway.
6.6 Direct Lot Access

i. Council may consider direct lot vehicle access on District Collectors and lower order roads dependent on the traffic environment modelled for the corridor. The following table provides a guide to where access may be appropriate based on the number of Vehicle Per Day subject to detail design.

<table>
<thead>
<tr>
<th>Vehicles Per Day</th>
<th>1000</th>
<th>2000</th>
<th>3000</th>
<th>4000</th>
<th>5000</th>
<th>6000</th>
<th>7000</th>
<th>8000</th>
<th>9000</th>
<th>&gt;10000</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direct Lot Vehicle Access</td>
<td>Allowed</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Not Allowed</td>
</tr>
</tbody>
</table>

6.7 Medians

i. Not withstanding the requirements of a specific street or road typology, where Medians are required for safety reasons (i.e. pedestrian crossing refuges, protected turning, intersection design, split grade carriageways, etc.) as a result of detailed design, or to create a boulevard, they can be accommodated on any Functional Road Hierarchy classification.

ii. The overall width of all road reserves as specified in the cross section attributes is to be widened by the required width of median unless otherwise agreed to by Council.
## 7. Recommended Posted Speed Limits

8. Primary and Secondary Active Transport Network

The primary and secondary active transport networks are identified on the Primary and Secondary Active Transport Network Overlay Map. These networks incorporate the most critical inter and intra-regional trips for cyclists and pedestrians. As development occurs, works and/or land may be required in the provision of these networks. A determination will be made as to the extent of works and/or land required as part of the development assessment process. In circumstances where the attributes of the primary or secondary active transport network vary from the pathway width and cycle lane attributes mentioned in other parts of Appendix A of the PSP - Integrated Design, the attributes contained in Table 5.1 prevail. The table below prevail.

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td>≤3km from centre</td>
<td>On-road facility:  • as per the relevant cross section attributes table (contained within section 4).  Plus off-road facility:  • as per the relevant cross section attributes table widened by an additional 0.3m; or  • if shared off-road pathway only &gt;3.5m.</td>
</tr>
</tbody>
</table>
9. Transitions
The applicable cross section is to transition depending on its adjoining zone and precinct. As illustrated below, a single functional road and street classification such as a Local Access Street may have a different applicable cross section as it moves through different environments. How road and street types transition between each other will be specific to each situation, however, consideration needs to be given to safety for pedestrians, cyclists and vehicles as well as adjoining land uses and infrastructure. Generally, a higher order cross section should be continued to the next intersection.

Where a street or road adjoins a different residential precinct on the either side of the street or road, the cross section required for the particular street type in the higher order precinct is to be provided. For clarification the following table lists the priority of precincts for road and street type selection.

### 6.1 Precinct Priority

<table>
<thead>
<tr>
<th>General Residential Zone</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Urban Neighbourhood Precinct</td>
</tr>
<tr>
<td>2. Next Generation Neighbourhood Precinct</td>
</tr>
<tr>
<td>3. Suburban Neighbourhood Precinct</td>
</tr>
<tr>
<td>4. Coastal Communities Precinct</td>
</tr>
</tbody>
</table>
10. Retrofitting Existing Streets

Where establishment of a desired road or street typology cross section is to be achieved through retro-fitting of an existing reserve, the following is to be used as a guide to which elements of the road or street typology cross section could be reduced if the existing reserve is inadequate. Every endeavour is to be made to maintain the existing alignment of kerbs, however the order of which elements are to be identified for modification will differ between those roads with a “place” function and those with a “movement” function as determined in Section 2 of this Appendix.

The hierarchy of modifications to be considered is as follows (with the elements to be considered for reduced first appearing first in the listings below):

“Movement” types:

1. Reduce kerbside parking width (to a minimum of 2.4 metres)
2. Remove kerbside parking from one side
3. Remove kerbside parking from both sides
4. Reduce or remove “rear” verge (whilst maintaining a minimum 3.5 metre total verge width)
5. Reduce footpath (to a minimum of 2.0 metres whilst maintaining a minimum 3.5 metre total verge width)
6. Reduce cycle lanes (to a minimum of 1.5 metres where speed is not in excess of 60kph)
7. Reduce lane width to 3.3 metres

“Place” types:

1. Reduce lane width to 3.3 metres
2. Reduce cycle lanes (to a minimum of 1.5 metres where speed is not in excess of 60kph)
3. Convert cycle lanes to Cycle Awareness Zones (in conformance with technical standards)
4. Reduce or remove “rear” verge (whilst maintaining a minimum 4.5 metre total verge width)
5. Reduce kerbside parking width (to a minimum of 2.4 metres)
6. Remove kerbside parking from one side
7. Remove kerbside parking from both sides

Where the existing configuration includes a road and street reserve and/or pavement width is wider than required by the applicable typology cross section, council will determine how the additional space is to be best utilised.

Where kerbside parking is retained and verge width is constrained for tree planting, consideration will be given to including tree planting within the parking lane using permeable pavements and structural soils. Note every endeavour must be made to retain existing vegetation within road and street design including through tunnel trenching (utility services), raised footpaths / bike paths with pier foundations to avoid tree root severance / damage.
11. Pedestrian Crossings Design and Location

13. Pavement Design and Construction

13.1 Pavement and Median Crossfall
Roads and streets on straight alignment shall be designed with a normal crossfall of pavement and shoulders of 3%. Where steeper or flatter crossfalls than the normal are required, for example on superelevated curves at intersections or turning areas, the maximum and minimum permissible pavement crossfalls shall be 5% and 2% respectively with consideration of high vehicles turning.

At intersections and cul-de-sac heads contour details are required to demonstrate that there is no ponding of water. Where minimum crossfall cannot be achieved the longitudinal grades may be used to shed the water.

The desired maximum crossfall for grassed medians on divided roads shall be 1 in 6 with an absolute maximum of 1 in 4. At median openings, the pavement crossfall should not exceed 5%.

Split level and divided roads/streets should be avoided. Where this is not possible, prior written approval shall be obtained from Council’s nominated representative.

13.2 Pavement Tapers
Pavement tapers to existing construction shall be designed in accordance with the current AUSTROADS based on the design speed as accepted by Council’s nominated representative. Detailing should include lengths, typical section(s), linemarking and signing. Tapers shall be constructed to the same standard as the proposed full road pavements.

13.3 Kerb and Channel
Kerb or kerb and channel shall be provided on both sides of road pavements on all urban and rural residential roads unless otherwise approved by Council.

Kerb and channel or concrete lined table drains shall be provided on all Rural roads when grades are in excess of 10%. For soils which are easily eroded, kerb and channel or concrete lining will be required when the grades of rural roads are greater than 7%. Consideration may be given to using kerb and channel through deep cuttings.

Unless otherwise approved, the type of kerb and channel used shall be as listed below and shall be designed in accordance with IPWEAQ Standard Drawings for Kerb Profiles:

- Industrial and Commercial areas and Park frontages - Barrier kerb (B1 300)
- Traffic islands - Barrier (B5) Semi Mountable (SM3) Modified to key in 125mm below pavement surface
- Roundabouts – SM5
- Non-channelled roads – edge beam M6 or B3 ER2
- All other locations - Mountable kerb (M3)

The desirable minimum longitudinal grade for kerb and channel shall be 0.5%. Pavement of minimum depth of 125mm is to extend a minimum of 150mm behind kerb and channel.

Where proposed construction adjoins existing kerb and channel Council’s nominated representative shall decide whether the existing profile shall be extended or whether the new construction will be tapered smoothly to the existing kerb and channel.

13.4 Subsoil Drainage
Subsoil drains shall be provided beneath all kerb and channel. On roads with no kerb and channel, subsoil drainage will be required where poor subgrade drainage exists and at locations directed by Council’s nominated representative. Subsoil drainage is to be provided in accordance with I.P.W.E.A.Q. Standard Drawings subject to the details described below.
• Pavement of minimum depth of 125mm is to extend a minimum of 150mm behind kerb and channel; and
• Subsoil drainage trench backfill is to extend to the underside of the kerb.

Trimming and compaction of subgrade is to be completed and approved before subsoil drains and service conduits are constructed. The trenches shall then be excavated, and the excavated material placed on the footpath and not the subgrade.

Where subsoil drains pass under service conduits, the side drains are to be deepened and graded out to a normal depth at a minimum grade of 1:250.

For roads without kerb and channel the subsoil drainage trench is to be 300mm wide and positioned such that the outer edge of the trench is in line with the outer edge of the pavement seal. The subsoil drainage is to be centrally located within the trench.

In dispersive, soluble or fine grained soils, the developer’s representative is to evaluate whether geofabric wrapped subsoil drains are required. Where geofabric wrapped subsoil drains are proposed the developer’s representative is to provide details for approval by Council’s nominated representative.

Road subsoil drainage must be ‘daylighted’ and discharged to an approved legal point of discharge. Caps are to be provided to upstream ends of subsoil drains.

13.5 Pedestrian and Cycle Infrastructure
Pedestrian and Cycle infrastructure is to be provided for as identified in the Road and Street Typology Cross Section. Refer to AUSTROADS for additional guidance in relation to detailed design and construction requirements.

Pathway construction is to be in accordance with I.P.W.E.A.Q. Standard Drawings. Where applicable the path is to be removed and replaced with a standard crossover. The crossover is to give priority to the footpath profile. New concrete pathways are to be pinned to adjacent concrete infrastructure.

All new concrete pedestrian and cycle infrastructure is to be pinned to adjacent existing concrete infrastructure (driveways, pathways, etc.) using N12 dowel bars in accordance with Council’s Standard Drawings and subject to the following requirements:
  a) The dowel bars are to be placed along the pathway midway between joints at 300mm centres.
  b) The dowel bar end within the existing concrete is to be epoxy bonded to the existing concrete and the section of the bar within the new concrete is to be greased.

Where a concrete pathway crosses a commercial or industrial driveway, the pathway is to be a minimum of 150mm thick N32 concrete with SL82 reinforcing.

Asphaltic concrete (A.C.) and gravel path locations and depths are to be approved by Council’s nominated representative. Where approved, pathways are to have 25mm thick A.C. surfacing on Class 2.3 gravel of an approved depth (minimum 100mm).

13.6 Kerb Ramps
Kerb ramps are to be provided at all intersections, at all kerb returns and at the end of all pathways i.e. between lots, park access, etc. At intersections, the ramps are to be located in accordance with AS1428 Design for Access and Mobility to align with existing or future pathways. Tactile indicators are to be installed in accordance with AS 1428.4.

Kerb Ramps are to be constructed in accordance I.P.W.E.A.Q. Standard Drawings. Kerb ramps are to be directional in all instances.

13.7 Grassing
Minimum fifty (50) millimetres compacted thickness of approved topsoil shall be placed over the balance areas of all footpaths and pathways, where the subsoil has the capacity to support sustained grass
growth. In known problem soils, depth of topsoil is to be increased to 100mm. **As a minimum the verge is to be fully turfed. Landscaping of verge areas is to be approved by Council’s representative, however, all balance areas of the verge are to be turfed. These areas are then to be grassed or landscaped and are to be properly established and maintained during the maintenance period. Refer to the Appendix D – Landscape Design and Street Trees.**

### 13.8 Road Edge Guide Posts and Guardrails

Road edge guideposts shall be provided at all locations where kerb and channel is not constructed e.g. half road construction, tapers, ends of roads, etc. in accordance with Department of Main Road Manual of Uniform Traffic Control Devices. Guard rail locations and installation is to be as per AUSTROADS Guide to Road Design.

### 13.9 Pavement Design

This section is intended to facilitate the checking and approval of proposed pavement designs for roadworks associated with subdivisions, building development and re development works. It is not intended to be used in lieu of design manuals. Pavement designs are to be submitted and approved by Council.

The pavement is to be designed in accordance with AUSTROADS Guide to Pavement Technology including design parameters, subgrade evaluations, laboratory testing and design charts. The design pavement depth does not include the asphaltic concrete (A.C.) surfacing where the A.C. surfacing thickness is less than 50mm.

The proposed pavement design is to be submitted for approval at least five (5) days prior to a subgrade inspection.

### 13.10 Determination of Subgrade Strength

A design California Bearing Ration (CBR) is to be determined for each identifiable unit defined on the basis of topography, geological and drainage condition of the site. The four day soaked CBR at a compaction of 100% Standard compaction is to be the standard test. Tests are to be carried out in a NATA registered laboratory (National Association of Testing Authorities).

The test results are to be submitted with the proposed pavement design. The design CBR is to be detailed on plans.

The sampling is to be randomly located within each length of the proposed roadway with constant subgrade material. It is required that a minimum of 1 test per material type be carried out. The location of material type variances are to be detailed in accordance with sample test and adjoining lot. For less than five results the design CBR shall be the least estimated insitu CBR result. For more than four results, the design CBR shall be the 10th percentile of all estimated insitu CBR results. The samples shall be taken generally in the position of the outer wheel path on both sides of the proposed road. A sketch plan showing the location of all tests is to be submitted with the test results for pavement design approval.

### 13.11 Design Basis

The design traffic in Table 813.11 below shall be adopted unless the developer’s representative submits to Council, and has approved, alternative design traffic values. To determine the design traffic the developer’s representative shall use the methodology in the AUSTROADS design manuals.

Street and Road Pavements shall be designed in accordance with AUSTROADS Design Manuals, utilising such amendments and additional criteria stated in this manual. The pavement design life adopted for all roads is to be 20 years. The minimum pavement depth is 200mm. The minimum pavement depth does not include the asphaltic concrete surfacing. **The minimum pavement layer thickness for minor roads is 100mm and for major roads is 125mm.**

Where pavement widening is required, testing/onsite inspection is to be undertaken to demonstrate that there is existing quality gravel in the road pavement to a depth that satisfies the classification typology of the road. Where this is evident the widening is required to be constructed to full pavement depth as approved by Council’s nominated representative in accordance with the classification typology of road.
Where existing quality gravel of suitable depth cannot be demonstrated the road must be constructed with full depth pavement. Where a development permit does not condition a minimum width, the road must be constructed with full pavement and seal to the (ultimate) centre line of the road or a minimum of 3 metres, whichever is the greater.

13.12 Pavement Materials
Pavement Materials shall be in accordance with Main Roads Technical Specifications (MRTS 05) for Unbound Pavements. The minimum gravel material types for lower sub-base, upper sub-base and base are 2.5, 2.3 and 2.1, respectively. Where a single sub-base layer is nominated Type 2.3 material shall be used. The use of recycled unbound pavement material is subject to a Council product approval. Alternative product proposals shall receive written product approval from Council prior to use.

A copy of the material grading and CBR are to be provided to the nominated representative prior to acceptance of on maintenance, at the time of sub grade inspection and attached to Council’s checklist. Compaction testing results are to be recorded and provided to the nominated representative upon their request and as part of the on maintenance documentation. If these details are not available the Contractor shall carry out testing suitable to verify the stability and quality of the pavement layers and submit these results to Council as part of the on maintenance documentation.

13.13 Surfacing
In urban and rural residential areas, the Asphaltic Concrete (A.C.) surfacing thickness is to be:
- 25mm (BCC Type 2) on Access type streets and Laneways with traffic volumes less than 4 x 10⁵;
- 50mm (BCC Type 3) for Arterial and Sub Arterial roads; and
- 40mm (BCC Type 3) for all other streets.
In Commercial and Industrial areas the minimum A.C. surfacing thickness is to be 40mm.

Where stencilled or patterned surface treatments are proposed an additional 510mm shall be added to the design thickness of the surfacing. The A.C. Binder type is to be in accordance with AUSTROADS. A.C. Surfacings are to be constructed in accordance with Brisbane City Council Standards (BCC S310 Supply of Dense Graded Asphalt and S320 Laying of Asphalt).

Primers seals are required to be placed under all asphalt surfaces. Primer seals shall consist of cutback bitumen (AMC4) or bitumen emulsion to Main Roads Specification (MRTS 11 Sprayed Bituminous Surfacings excluding Emulsions) and MRTS 12 Sprayed Bituminous Emulsion Surfacings) with 10mm aggregate. Where cutback bitumen is used the minimum curing time before the next sealed layer (asphalt) can be placed will be fourteen (14) days. Where bitumen emulsion is used the minimum curing time before the next sealed layer (asphalt) can be placed will be four (4) days.

Application rates of primer binder and aggregate are to be designed in accordance with the current edition of AUSTROADS Practitioners Guide to Design of Sprayed Seals.

In rural areas bitumen spray seal surfacing is to be provided in the form of a 2 coat Polymer Spray Seal (14mm/7mm) in accordance with Main Road Technical Specifications (MRTS 18 Polymer Modified Binders, MRTS 11 Sprayed Bituminous Surfacings excluding Emulsions).

The Degree of Saturation of base course prior to surfacing is to be less than 65%. Test results demonstrating degree of saturation this are to be provided to Council’s nominated representative at the preseal inspection and as a part of the on maintenance documentation.

For Rigid pavements, concrete and gravel thicknesses are to be designed in accordance with AUSTROADS Design Manuals. Notwithstanding the above, unless otherwise approved by Council’s nominated representative, the minimum thickness of the reinforced concrete pavement shall be 175mm with a minimum of 100mm type 2.3 compacted gravel.

Colouring of stencilled or patterned concrete shall be subject to approval of Council nominated representative. Particular attention is to be given to the selection of surface treatments which ensure that appropriate skid resistance is maintained. Where colouring of the rigid pavement is proposed, the complete pavement mix is to be coloured. Light colours are to be avoided.
Where the rigid pavement section being designed is less than 25m in length and is abutted by flexible pavement which is greater than 275mm then the combined thickness of the rigid pavement and its supporting sub base shall be equivalent to the combined thickness of the abutting flexible pavement base, sub base and select material courses.

13.14 Pavement for Low Subgrade CBR
If the Design CBR determined for the subgrade is less than the minimum CBR 3, then the following is required:
- replacement with 300mm, minimum CBR 15 replacement material; and
- re-design pavement based on CBR 3 or design in accordance with AUSTROADS.

Alternative designs incorporating geogrids and geofabrics will be considered when submitted for approval by an appropriately qualified and experienced engineer.

</tbody>
</table>

13.15 Construction
Each pavement course should not be commenced until the previous course, i.e. subgrade, sub base/s, base or existing pavement, has been inspected and approved and certified by the consultant with respect to compaction, finished levels and texture of finish. Compaction tests of each layer are required and consultants must ensure that all tests are satisfactory before proceeding to the next layer. All test results are to be provided to Council’s nominated representative prior to surfacing.

13.16 Subgrade Preparation
Subgrade is to be trimmed to an even surface free from loose material and graded to be free-draining. Unsuitable material such as organic matter is to be removed. Subgrade affected by rainfall after final trimming shall not be accepted until appropriate drying out treatment has been affected. Appropriate management of subgrade with moderate to high shrink/swell index.

13.17 Unbound Pavement Course Placement
Unbound pavement course material is to be placed only on underlying layers maintained at the correct moisture content. Prepared subgrades and preceding layers of base course shall be moistened immediately prior to spreading the next course.

Pavement material should is to be maintained at the specified moisture content prior to and during spreading. The leading edges of the pavement material are to be kept moist. Minimum compacted layer thickness shall be 100 millimetres and maximum compacted thickness shall be 150mm.

13.18 Compaction Testing and Frequency
Determination of the compaction performance of the subgrade and pavement gravel materials – laboratory reference density, field density, optimum moisture content, field moisture content -shall be carried out in accordance with AS1289 Methods of Testing Soils for Engineering Purposes, in particular the E series tests. The laboratory reference density shall be:
• Natural Subgrade - 100% Standard Maximum Dry Density (MDD)
• Pavement upper and lower sub base layers – 100% Standard Maximum Dry Density (MDD)
• Pavement base layer - 102% Standard Maximum Dry Density (MDD)

The minimum frequency of testing shall be in accordance with Council’s Planning Scheme Policy Operational Works Inspections, Maintenance and Bonding procedures.

A minimum of three (3) tests per project will be required. A sketch plan showing the location of the tests is to be submitted with the results. All tests are to be distributed reasonably evenly through the full depth and area of pavement.

The testing frequencies stated above are based on a "not one to fail" basis. Failure of compaction tests on any layer will require:

• Removal or reworking of material; and
• Re-testing; and
• Resubmission of failed test results, successful test results and description of remedial treatment undertaken at the developer’s representative’s directions to Council’s nominated representative prior to the relevant inspection.

13.19 Pavement Depth Verification

Pavement depths shall be verified by the provision of as constructed levels of the subgrade and pre-seal stage (or top of kerb if installed) at a frequency of three (3) levels (right hand side, centre and left hand side) every 50 metres. The surveyed information is to be provided in a tabulated format and is to be certified by both the surveyor and consulting engineer provided with on maintenance submission.

14. Driveways and Pedestrian Crossovers

Note - Where self-assessable crossover works are undertaken:
   a) the construction is the responsibility of the property owner;
   b) the construction is at the risk of the property owner;
   c) the construction of the kerb and channel (where required by the Planning Scheme) is considered part of the construction of a driveway crossover and is therefore the responsibility of the property owner;
   d) it is recommended “Dial Before You Dig” is contacted if excavation is required;
   e) any damage caused by crossover works or damage not notified to Council prior to commencing crossover works will be repaired at the property owner’s expense;
   f) crossovers that do not comply with the criteria as listed below, and where an approval has not been sought from Council, the applicant may be directed to undertake modifications at the property owner’s expense;

14.1 Driveway crossover and driveway

For the purpose of this Planning scheme policy, the following terms are defined as:
   a) driveway crossover is a constructed access crossing connecting a property boundary with the carriageway;
   b) driveway is an access crossing connecting the on-site vehicle accommodation or standing area to the property boundary;

For the purpose of constructing a driveway crossover, Moreton Bay Regional Council grants permission to carry out work on a Road Reserve or on Council Owned Land, subject to the following criteria:

14.1.1 Dwelling houses

This section provides the self-assessable criteria for the location, design and construction of driveway crossovers and driveways associated with Dwelling houses.

14.1.1.1 Location
   a) Driveway crossovers and driveways are located so as to provide a clear view of passing pedestrians, cyclists and vehicles.
b) driveway crossover of one allotment does not encroach on the frontage of an adjacent allotment;

c) driveway crossovers do not directly adjoin painted or concrete traffic islands on the road;

d) driveway crossovers are setback a minimum 1m from any stormwater pit, electricity pole or road sign;

e) driveway crossovers are setback a minimum 3m from any streettree;

f) driveway crossovers and driveways do not disturb, cover or restrict access to:

i. a survey mark;

ii. water meters, fire hydrants or valves;

iii. the water supply pipe between the main and the meter;

iv. a Council or public sector entity easement;

v. utility corridors and pits (e.g. Telstra, NBN, Gas)

g) driveway crossovers and driveways are setback a minimum 10m of the approach side of a bus stop;

h) driveway crossovers and driveways are located clear of the prohibited locations as referenced in AS2890.1.

14.1.1.2 Design

a) where for a Dwelling house subject to the Dwelling house code:

i) driveway crossover widths are a maximum 40% of the frontage access is being obtained from, or 4.8m whichever is the lesser. No maximum for a laneway lot.

ii) driveways do not include a reversing bay, manoeuvring area or visitor parking spaces (other than tandem spaces) in the front setback

b) where for a Dwelling house not subject to the Dwelling house code, driveway crossover widths are in accordance with the relevant standard drawing - (RS-049, RS-050) or RS-056.

c) driveway crossovers are designed in accordance with the relevant standard drawings in Appendix H of Planning scheme policy - Integrated design;

d) driveway crossovers match the level of the existing concrete footpath or finished ground level where there is no footpath;

e) where a driveway services multiple allotments, the design traffic ESA of driveway crossovers is to be 2.5 \times 10^3 per property serviced.

14.1.1.3 Construction

a) driveway crossovers are to be constructed from concrete (includes plain, coloured or stencilled/stamped concrete and exposed aggregate concrete), asphalt orbitumen

b) adequate warning of the presence of works on a Road Reserve or Council Owned Land shall be given in accordance with the Manual of Uniform Traffic Control Devices (MUTCD). The MUTCD is available free from Transport and Main Roads website: http://www.tmr.qld.gov.au/business-industry/Technical-standards-publications/Manual-of-uniform-traffic-control-devices

c) between sunset and sunrise such warning is to consist of a barrier with warning flags or a warning sign on each side of the crossover works;

d) any steps necessary for the protection of the public shall be taken by the applicant at the applicant’s expense;

e) all driveway crossover works shall proceed without any interruption to traffic. If traffic lane closure is required, the person carrying out the works shall have the “Notification of Temporary Road Closure” form approved prior to any road closure occurring. Works shall be carried out in accordance with the MUTCD

f) the driveway crossover works are to be backfilled, consolidated and the surface reinstated immediately after the works are completed;

g) any subsidence or other damage which occurs and is attributable to the driveway crossover works are to be repaired by the applicant;

h) the applicant is to obtain a Public Liability Insurance Policy or not less than $20 million covering any risk arising from the proposed driveway crossover work.

i) a minimum 1.5m pedestrian throughway shall be maintained at all times during the driveway crossover works. This pedestrian throughway shall be of equivalent standard to adjoining or
Planning Scheme Policy - Integrated Design

14.1.1.4 Rear of allotment driveways

a) Access handles for rear lots are to contain a driveway and provision for services appropriate to the use. The driveway is to be designed with a loading of $2.3 \times 10^3$ ESA for each lot entitled to use the driveway. The driveway is to be sealed for a minimum width of 3.0 metres. Additional width or passing bays maybe required on long driveways to facilitate vehicles passing along the length of the driveway. For urban residential driveways the construction shall be reinforced concrete slabs or interlocking concrete pavers. For non-urban residential driveways the construction shall be reinforced concrete slabs or a 2 coat sealed gravel pavement or 25mm asphalt sealed gravel pavement. The minimum gravel pavement shall be of type 2.1 gravel with compacted thickness of 150mm.

b) Appropriate longitudinal drainage, cross drainage and scour/erosion protection works must be provided. The appropriate longitudinal and cross drainage design requirements can be located within Planning Scheme Policy Integrated Design Appendix C. The general maximum longitudinal grade shall be 16%. Consideration is to be given to the maintainability of unsealed sections of the access handle and appropriate longitudinal and cross-sectional grades.

c) Conduits are to be installed for underground electricity supply and telecommunications, including draw wires within, for the entire length of the access handle.

d) Bin pads are to be provided for lots with rear of allotment driveways, shared driveways or lots that do not have sufficient frontage to allow waste vehicle access to the kerb. Bin pads are to be constructed from 125mm thick reinforced concrete within the front verge immediately behind the back of kerb. Bin pads are to be 2 metres long x 1 metre wide for each allocated lot to allow for general and recycling waste collection and are to be located at the closest reasonable location to the allocated lot. Bin pads are to be clear of crossover flares and other utilities and street trees in the footpath area.

e) Bin pads are to be painted with house numbers (not lot numbers) to show allocated lots prior to the acceptance of off maintenance. Adequate waste vehicle access to the adjacent lot where the bin pads are located must also be demonstrated and the space available to the adjacent lot for waste collection must not be compromised. Council may require that an additional bin pad is also constructed for the adjacent lot whose frontage is being used for bin pad construction.

14.1.2 Industrial and commercial uses

This section provides the self-assessable criteria for the location, design and construction of driveway crossovers associated with industrial and commercial uses.

14.1.2.1 Design

a) driveway crossovers are designed in accordance with the relevant standard drawings in Appendix H of Planning scheme policy - Integrated design;

b) driveway crossovers match the level of the existing concrete footpath or finished ground level where there is no footpath;

c) driveway crossovers are designed to cater for the following service vehicles:

### 14.1.2.2 Construction

a) adequate warning of the presence of works on a Road Reserve or Council Owned Land shall be given in accordance with the Manual of Uniform Traffic Control Devices (MUTCD). The MUTCD is available free from Transport and Main Roads website: http://www.tmr.qld.gov.au/business-industry/Technical-standards-publications/Manual-of-uniform-traffic-control-devices

b) between sunset and sunrise such warning is to consist of a barrier with warning flags or a warning sign on each side of the crossover works;

c) any steps necessary for the protection of the public shall be taken by the applicant at the applicant's expense;

d) all driveway crossover works shall proceed without any interruption to traffic. If traffic lane closure is required, the person carrying out the works shall have the “Notification of Temporary Road Closure” form approved prior to any road closure occurring. Works shall be carried out in accordance with the MUTCD

e) the driveway crossover works are to be backfilled, consolidated and the surface reinstated immediately after the works are completed;

f) any subsidence or other damage which occurs and is attributable to the driveway crossover works are to be repaired by the applicant;

g) the applicant is to obtain a Public Liability Insurance Policy or not less than $20 million covering any risk arising from the proposed driveway crossover work;

h) a minimum 1.5m pedestrian throughway shall be maintained at all times during the driveway crossover works. This pedestrian throughway shall be of equivalent standard to adjoining or closest existing footpath.

### 14.1.3 Pedestrian crossover and paths

For the purpose of this Planning scheme policy, the following term is defined as:

- **Pedestrian crossover** is a constructed access crossing connecting the property boundary with the footpath and is located in the rear verge between the property boundary and the footpath.
For the purpose of constructing a pedestrian crossover, Moreton Bay Regional Council grants permission to carry out work on a Road Reserve or on Council Owned Land, subject to the following criteria:

14.1.3.1 Location
a. pedestrian crossovers do not disturb, cover or restrict access to:
   i) a survey mark;
   ii) water meters, fire hydrants or valves;
   iii) the water supply pipe between the main and the meter;
   iv) a Council or public sector entity easement;
   v) utility corridors and pits (e.g. Telstra, NBN, Gas)

14.1.3.2 Design
a) pedestrian crossovers are a maximum of 1.5m wide and are designed in accordance with the relevant standard drawing in Appendix H of Planning scheme policy - Integrated design

14.1.3.3 Construction
a) pedestrian crossovers are to be constructed from concrete (includes plain, coloured or stencilled/stamped concrete and exposed aggregate concrete);
b) the footpath is to remain unobstructed at all times during the pedestrian crossover works. Where there is no footpath, a minimum 1.5m pedestrian throughway shall be maintained at all times during the pedestrian crossover works;
c) between sunset and sunrise such warning is to consist of a barrier with warning flags or a warning sign on each side of the pedestrian crossover works;
d) any steps necessary for the protection of the public shall be taken by the applicant at the applicant's expense;
e) the pedestrian crossover works are to be backfilled, consolidated and the surface reinstated immediately after the works are completed;
f) pedestrian crossovers are to be pinned to adjacent existing concrete infrastructure (driveways, pathways, etc.) using N12 dowel bars in accordance with Council's Standard Drawings and subject to the following requirements:
   i) The dowel bars are to be placed along the pathway midway between joints at 300mm centres.
   ii) The dowel bar end within the existing concrete is to be epoxy bonded to the existing concrete and the section of the bar within the new concrete is to be greased.
g) any subsidence or other damage which occurs and is attributable to the pedestrian crossover works are to be repaired by the applicant;
h) the applicant is to obtain a Public Liability Insurance Policy or not less than $20 million covering any risk arising from the proposed driveway crossover work.

15 Street Lighting and Public Utilities

15.1 General Requirements

Unless stated otherwise, the Developer is responsible for the design of public utility services including liaison with the relevant public utility authorities, supply and installation of all service conduits, including the provision of all services and/or conduits along the full length of any rear allotment access or access easement. The Developer must also meet the cost of any alterations to the public utility mains, existing mains, services or installations required in connection with the development. This includes the relocation of any fire hydrant and/or valves from within the limits of the development's vehicular crossings, if applicable.

If road or street widening is required along the frontage of the development, the Developer must relocate the services onto the correct alignment within the verge. In some instances, the services may need to be lowered to provide sufficient cover when the footpath is regraded to the design profile.
Services crossing existing arterial and sub-arterial roads are to be tunnel bored. Council may require that other Functional road hierarchy classifications be tunnel bored, depending on the condition of the existing road or street.

### 9.1 Location of Services

The service corridors and alignments must conform to the relevant Standard drawing. See Appendix H – Standard Drawings.

### 15.2 Street Lighting

#### 15.2.1 Principal Consultant

The Developer must appoint a suitably qualified Principal Consultant to liaise with Council for the approval of street lighting and electrical reticulation. The Principal Consultant must be a RPEQ and hold professional indemnity insurance to the value of not less than $1,000,000.

#### 15.2.2 Standards

Unless specified otherwise in this chapter or as directed by Council, the provisions and detailed design of street lighting installations must conform to the following standards.

#### 15.2.3 Lighting Category

The lighting categories referred to in AS 1158 are broadly described as follows:

- Category V lighting. Lighting which is applicable to roads on which the visual requirements of motorists are dominant, e.g. traffic routes.
- Category P lighting. Lighting which is applicable to roads on which the visual requirements of pedestrians are dominant, e.g. local roads and public activity areas.

### 9.3.3 Lighting Categories

| All roads           | Refer requirements section 9.4
|                     | Refer to locational requirements in section 15.2.4 (i) below. |
| **Pathways**        |                          |
| Between residential lots | P4                  |
| Open and civic space area | P4                   |
15.2.4 Alignment

Within access streets serving 20 lots or less, the streetlights are to be located on one side of the street only. Where a pathway is only located on one side of the street, the lighting is to be provided along the same side of the street as the pathway.

Within other access streets the streetlights are to be installed alternatively on opposite sides of the street (staggered arrangement).

The location of light poles should avoid the likely vehicle conflict points, minimise the risk of damage to both poles and vehicles and injury to vehicle occupants, minimise glare complaints, and minimise conflicting with driveway locations.

The following factors should be considered when determining the street lighting alignment:

a) The potential for vehicle collision on built to boundary lots and rear access lot driveways.

b) The pole type installed is to be in accordance with the requirements of the relevant Australian Standards have regard for the pole location and speed environment.

c) Locate street light poles in line with abutting property boundaries or on truncation points at intersections. In cul-de-sac locations, the alignment is measured along a line projected lot side boundary to the kerb.

d) Locating poles in cul-de-sac adjacent to narrow property frontages is undesirable due to possible conflict with adjoining driveways.

e) Lighting poles must be located in accordance with the relevant Standard Drawings. See Appendix H – Standard Drawings.

f) Where the footpath width exceeds 4.0 metres, the centre of the street lighting pole must be located 0.9 metres behind the kerb invert.

g) The preferred configuration of lighting at a roundabout is for the light poles to be located on the approach side of each intersection street without poles in the central median island. Lighting poles must be located as far as practicable, away from the intersection. Council would only consider the installation of central island lights if the aforementioned preferred lighting arrangement cannot be achieved, then the poles are of the cantilever (pivot arm) type and satisfactory maintenance vehicle access is provided clear of landscaping.

h) For bikeways, the lighting column must be located 1.2 meters from the edge of the bikeway pavement.

i) The proposed light must be at least 7.0 metres clear from any existing street trees.

15.2.5 Subdivisions & Other Developments

The specific requirements of new developments, in particular subdivisions, are as follows:

a) The lighting design must be cost effective in regard to minimising the annual operating costs and where possible, the installation capital costs. The Developer is responsible for all capital costs associated with the design and installation of the street lighting scheme.
Where it may be advantageous for the Developer to install lighting work outside the specified limits at the time of development, Council may contribute towards some of the capital costs, but these must be specifically agreed between the Council and the Developer. Council will only bear operating costs under Rate 2 of Energex’s Public Lighting Tariff.

b) Where the new development adjoins an existing street, the new poles/lights must match the existing types to the maximum practicable extent. This is not applicable when the existing road or street contains GI poles.

c) Where the development requires partial road or street construction (typically when the development adjoins an undeveloped site), the lighting must be designed for the full width. However, the lights on the development side only would need to be installed (assuming a staggered arrangement is required). In this instance conduits must be placed for future lighting on the non-constructed side.

d) Where major traffic routes (i.e. Category V road) are not likely to carry high volumes of traffic until the future stages are developed and occupied, either one of the following options is acceptable.

   i) Install half the ultimate lighting with the provision of conduits for the remainder lighting in the future.

   ii) Install smaller pole/lower wattage luminaries in the final position for upgrading at a later date. The use of base plate or rag bolt mounted columns in this case may be advantageous.

e) The lighting design for the development must integrate aesthetically with the adjoining / developments / estates / stages. Also the design must incorporate as far as practicable, the future planning of the area.

f) An aeroscreen luminaire on an integral 0.5 metre outreach must be used on a pedestrian laneway. The light will generally be located midway along the laneway at abutting property boundaries. If the laneway exceeds 60.0 metres then more than one light may be required. Hinging Base Plate Mounted (HBPM) columns must be used in this instance for maintenance purposes.

g) Underground electricity supply pillars must be provided at 150 metre intervals along park frontages for future supply to internal park lighting and other electrical park equipment.

h) Pedestrian underpasses require special consideration. The Principal Consultant must contact the Council Lighting Officer for site specific requirements before the commencement of design.

i) For subdivisions in the Rural zone and where allotment reticulation electrical supply is provided, suitable flag street lighting is to be provided in the following situations:

   i) Intersections & cul-de-sacs

   ii) Sharp bends

   iii) Traffic control devices

   iv) Culverts and bridges

   v) Identified traffic hazards

j) Provision of access for maintenance of lighting located within pedestrian and vehicle laneways is to comply with the specific requirements of the energy provider. Suitable vehicle access is to be provided for light poles no further than 100 metre walking distance from the service vehicle.
k) For subdivisions in the Rural residential zone, suitable street lighting to the required lighting category is to be provided in the following situations:

i) Intersections & cul-de-sacs
ii) Sharp bends
iii) Traffic control devices
iv) Culverts and bridges
v) Identified traffic hazards

l) Notwithstanding all the above items a) – k), Council may vary the required street lighting category for any street or road in consideration of special circumstances or require additional lighting in the following situations:

i) Intersections.
ii) Roundabouts.
iii) Sharp bends.
iv) Traffic control devices.
v) Pedestrian crossings/refuges.
vi) Cul-de-sacs.
vii) Bridges (minimum Category V5 at abutments and minimum Category P4 on deck).
viii) Night time accident locations.
ix) Frequently used night time bus stops.
x) Areas that may generate pedestrian traffic or vehicle night traffic.
xi) Wildlife movement and crossing locations

15.2.6 Decorative Lighting

Decorative lighting must not be used on Category V traffic routes. Council will not accept any decorative light or supporting pole for the lighting of public roads and laneways unless it is a standard stock item of Energex. If the development is an extension of an existing estate already installed with Nostalgia units, then the Developer must continue to use matching Nostalgia units.
15.3 Electricity

15.3.1 General

In the context of these guidelines, ‘underground electricity’ means the installation of conduits and supply of services such as electrical reticulation (up to and including 11 kV), pilot cables, street lighting, traffic signals and public lighting to transport facilities, parks, bikeways and telephone booths, etc. The provision of underground electricity is required within new developments except those in the Rural zone where overhead electricity is acceptable.

15.3.2 Approval Process

a) All the design and construction work on the electricity supplier’s (Energex) assets must be carried out by the electricity supplier or an approved electricity supplier’s consultant/contractor.

b) Prior to signing and sealing of the survey plan, a copy of a letter of agreement from the electricity supplier to provide the necessary services in accordance with approved electricity reticulation plans, must be submitted to Council. The Council’s endorsement of any survey plan proposing:

i. the creation of an additional lot; or

ii. substantial changes to a boundary of an existing lot, sufficient to affect the provision of reticulated electricity to an existing lot.

iii. a copy of the subdivider supply agreement or certificate of electricity supply from the electricity supplier to provide the necessary services in accordance with approved electricity reticulation plans, must be submitted to Council concurrent with any application seeking the Council to endorse the survey plan.

15.3.3 Subdivisions/Developments in the Rural Zone

The specific requirements of new developments, where within the Rural zone are as follows:

i. Development within 500 metres of the existing Electricity supply network. Where development is within 500 metres of an existing electricity supply network, the development is to connect to the existing network via underground or above ground connection in accordance with any Energex standards and approvals.

ii. Development not within 500 metres of the existing Electricity supply network. No minimum connection standard prescribed.

15.3.4 Subdivisions/Developments in all other zones

The specific requirements of new developments, in particular subdivisions in other than the Rural zone are as follows:

a) Development Involving the Dedication of New Road

i. For development other than in the Rural zone involving the dedication of new road for both freehold and community titled lots, full underground electricity reticulation including consumer service pillars must be provided within the road reserve to all allotments including adjacent parkland.

ii. Where necessary the Developer is to supply conduits across the road for the extent of any new road construction.

a) New Dedicated Roads
i) For newly dedicated roads, full underground electricity reticulation including consumer service pillars must be provided within the road reserve to all allotments including adjacent parkland.

b) Development on Existing Dedicated Roads (Including Road Widening)

a) Where development adjoins or is opposite a Park, foreshore area or Humpybong Reserve, the lot voltage (240V single phase / 415V three phase) and 11 kV must be converted to underground for the development frontage and the development/allotments supplied from consumer service pillars. The existing overhead lines and power poles are to be removed for the length of the development frontage (subject to Energex approval).

b) Where development does not adjoin or is not opposite park, foreshore area or Humpybong Reserve, and the overhead electricity reticulation exists along the frontage of the development and the development is and all the proposed allotments are to take access off the existing dedicated road:

1) The supply for the new development may be taken from existing overhead mains provided the development is not for a rear lot subdivision, the supply does not traverse another property outside the boundaries of the development, or require the installation of new overhead conductors across the road, or extended spans of overhead lines down pathways/driveways to new underground terminations. The supply must be taken either underground from the nearest existing overhead pole or traversed outside the development boundary. Private property poles will not be supported.

2) Where the development cannot achieve the above criteria, the lot voltage (240V single phase / 415V three phase) and 11 kV must be converted to underground and all allotments supplied underground from consumer service pillars.

3) Where the existing overhead lines do not continue to service other existing properties, the redundant overhead lines and power poles must be removed (subject to Energex approval) with the exception of small frontages (i.e. the development frontage lies wholly within 2 consecutive electricity poles spaced less than 100.0 metres apart) where the existing overhead lines may remain in parallel.

iii. Where the overhead electricity reticulation exists along the frontage of the development, but the proposed development/allotments are to take access and have electricity supply from an internal road system:

A) The low voltage (240V/415V) component of the existing overhead system along the external frontage of the development must be converted to underground and all allotments supplied underground from consumer service pillars.

B) Subject to Energex approval, Where the existing overhead lines do not continue to service other existing properties, the redundant overhead lines and power poles must be removed with the exception of small frontages (i.e. the development frontage lies wholly within 2 consecutive electricity poles spaced less than 100.0 metres apart) where the existing overhead lines may remain in parallel.

C) Conduits must be installed for either the future undergrounding of the existing 11 kV component or new proposed future Low Voltage (240V/415V).
a) Where necessary the Developer must supply conduits across the road, such as existing properties on the opposite side of the road outside the development boundary, for the extent of any new road construction.

b) If the supply for the new development is to be taken from existing overhead mains, then the supply must be taken underground from the nearest existing overhead pole at or outside the development boundary. It is unacceptable to install new overhead conductors across the road or extend spans of overhead lines down a footpath to new underground termination poles.

c) Existing Houses/Buildings
   i) Where an existing dwelling/building is to remain within the limits of a development, and all other lots/development is to be supplied by new underground reticulation, then any existing overhead electricity (and telecommunication) service to the building must be converted to underground.

d) High Voltage Feeders (33 KV and Higher)
   i) All existing conductors of 33kV or higher may remain overhead. However if the Developer wishes to remove high voltage feeder lines, the necessary approvals must be obtained direct from Energex/Powerlink and Council.
   ii) New or relocated > 33kV systems may by overhead at the discretion of Energex/Powerlink.

e) Transformers (PMT and PT)
   i) Generally all new transformers required for a development must be the pad mounted transformer (PMT) type even if their location is remote from the development, except under the following circumstances:

   A) For a small development in a fully developed area, the use of a PT and extension of 11 kV may be considered upon request. This option is mainly restricted to industrial developments.

   B) Existing pole transformers are not to be upgraded for supply of electricity to new subdivisions.

   C) PMT locations are to be in addition to the nominated road reserve. Any PMT’s located adjacent to park area are to be excised from the park area.

f) Low Voltage Supply (240V/415V)
   i) Where an existing Low Voltage Overhead supply traverses an existing parcel of land that is to be subdivided into smaller allotments, the supply to the newly created lots is to be serviced through the road fronting the development and any existing low voltage supply traversing the lots to be terminated. Council will not favour wayleave arrangements for electrical supply traversing lots on any new developments.

g) Spare Conduits
   i) Council reserves the right to specify spare conduits for future use on half/full width road crossings for the extension of service to/from adjacent existing and future developments. (Note: Where rear access lots or lots with a narrow access easements are proposed, future electrical and telecommunication conduits are to be installed for the full length of the access handle or easement before any concrete driveways are installed).
ii) It is the responsibility of the electricity supplier to ensure that the quantity of conduits installed within the development will also cater for any future mains upgrade.

h) Costs
i) The Developer is responsible for all the design (including that pertaining to item 9.6.3 b) iii) above) and construction costs including any relocation of Energex assets, if required as part of the development.

15.4 Gas
If underground gas is to be supplied to the new development, these service conduits must be shown on the engineering plans. Gas services are in accordance with the service provider’s requirements.

15.5 Telecommunications
a) Underground telecommunication services must be provided separate to the electricity service, to all allotments. Where overhead telecommunication lines exist along the development frontage, the same conditions as per overhead electricity will apply as per (also refer Section 9.6.3 b) ii)).

b) Prior to signing and sealing of the survey plan, a copy of a letter of agreement from the telecommunication carrier to supply the necessary services must be submitted to Council.

c) Telecommunication cabinets are to be located in widened sections of the road or street reserve.

d) Telecommunication services are in accordance with the service provider’s requirements.

15.6 Sewer
15.6.1 Service connection
a) Where in the Centre zone, Community facilities zone, Emerging community zone - Transition precinct, General residential zone, Industry zone, Recreation and open space zone, Township zone, Redcliffe Kippa-Ring Local Plan and Caboolture West Local Plan - Urban living precinct where on a serviced lot, all development is to be connected to the reticulated sewerage system in accordance with South East Queensland Water Supply and Sewerage Design and Construction Code and the relevant Water Service Association of Australia (WSAA) codes and standards.

b) Where in all other zones and local plan precincts:
   i) Where the development is in a sewerage connection area or sewerage future connection area as detailed in the Unitywater Connections Policy, all allotments are to be connected to the reticulated sewerage system.
   ii) Where the development is not in a sewerage connection area or sewerage future connection area as detailed in the Unitywater Connections Policy, each allotment is to contain and be serviced by an appropriate onsite sewerage facility.
      A) A site and soil evaluation report may be required where an on-site sewerage facility is proposed. Reports are to be prepared in accordance with AS/NZS 1547 On-site domestic wastewater management and the Queensland Plumbing and Wastewater Code. The report is to include a review of the existing on-site effluent disposal system including setback requirements.
      B) On-site sewerage facility in the Water supply buffer on Overlay map - Infrastructure network must comply with the relevant assessment criteria.
15.6.2 Trade waste
   a) Trade waste is to be pre-treated on site prior to discharging into the reticulated sewerage network.

15.7 Water
   a) Service connection
      i) Where in the Centre zone, Community facilities zone, Emerging community zone - Transition precinct, General residential zone, Industry zone, Recreation and open space zone, Township zone, Redcliffe Kippa-Ring Local Plan and Caboolture West Local Plan - Urban living precinct where on a serviced lot, all development is to be connected to the reticulated water supply system in accordance with South East Queensland Water Supply and Sewerage Design and Construction Code and the relevant Water Service Association of Australia (WSAA) codes and standards.
      
      ii) Where in all other zones and local plan precincts:

      A) Where the development is in a water connection area or water future connection area as detailed in the Unitywater Connections Policy, all allotments are to be connected to the reticulated water system.

      B) Where the development is not in a water connection area or water future connection area as detailed in the Unitywater Connections Policy, each allotment is provided with a potable water supply of at least 45,000 litres by way of on-site storage which provides equivalent water quality and reliability to support the user requirements of the development.
16 Street and Road Typology Cross Sections

The following figures have been relocated to Section 5 of this document.
10.8 DISTRICT COLLECTOR
